

## **HRMTEC ribbon printing system – computer-aided stamping machine with hot stamping**

**Stamping machine from HRMTEC enables high cost savings and is unique in the market.**

Wettswil – June 1, 2017

---

The stamping machine from HRMTEC is the only computer-aided stamping machine available on the market. The system, which uses a hot stamping process, has been developed exclusively for the ribbon printing and is fully industrial suitable. The system is independent of large manufacturers as it has been designed and developed entirely by HRMTEC.

All common materials available on the market are printable, so that means cloth, paper and foil / plastic. HRMTEC also offers a wide range of metallic and nonmetallic stamping foils. In particular, the high-precision metallic colors stamping in gold and silver is unique in the market.

The ribbon printing system HRMTEC allows stamping widths of 40mm - 256mm. The stamping foil is used only in the printable area and is not carried on not to be stamped areas. This allows an enormous cost saving in the stamping process, which again is unique in the market.

HRMTEC offers with its computer-aided stamping system very good printing quality for all common ribbon materials, including shadow printing, and low printing costs, and also the complete ribbon printing portfolio from products to services.
